Features

A roller debarker from BE&E is capable of debarking softwood or hardwood and excels at debarking wood that is typically challenging, such as frozen wood, crooked wood, and wood species with stringy bark.

It's the right debarker for high-volume pulpwood debarking.

- Effective debarking with minimal fiber loss
- Great for crooked, short, and small woods
- Modular construction with up to three modules

Operation

- Log diameter range: 3 to 32 in.
- Length range: 40 in. to 20 ft.
- Capacity: up to 150 tons/hour with 3 modules in line
- Can be easily reconfigured for softwood or hardwood
- Variable speed, independently driven rollers

Vs. Drum Debarkers

Compared to drum debarkers, our roller debarker:

- Can also be used for contaminant removal
- Has higher recovery of small-diameter wood
- Requires less energy
- Is quieter
